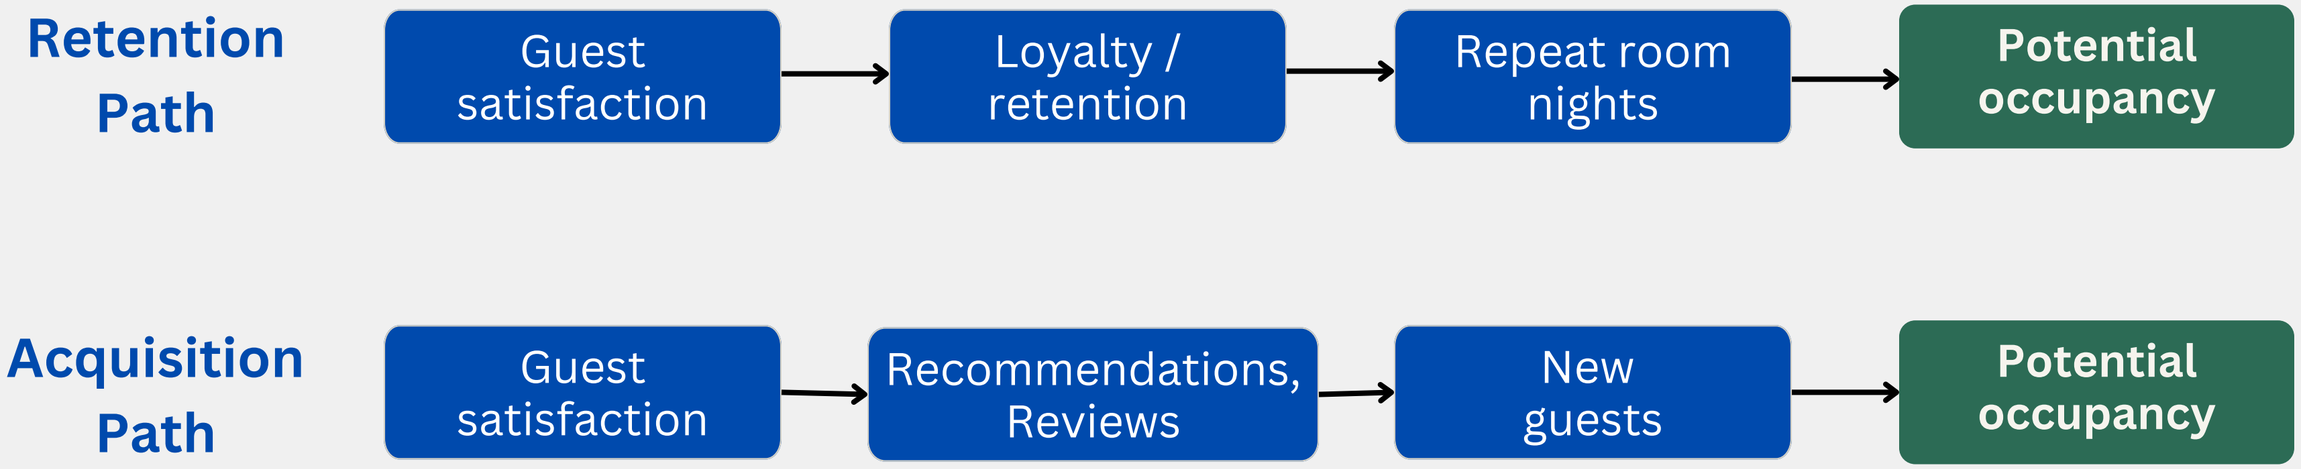
CUSTOMER SATISFACTION & OR



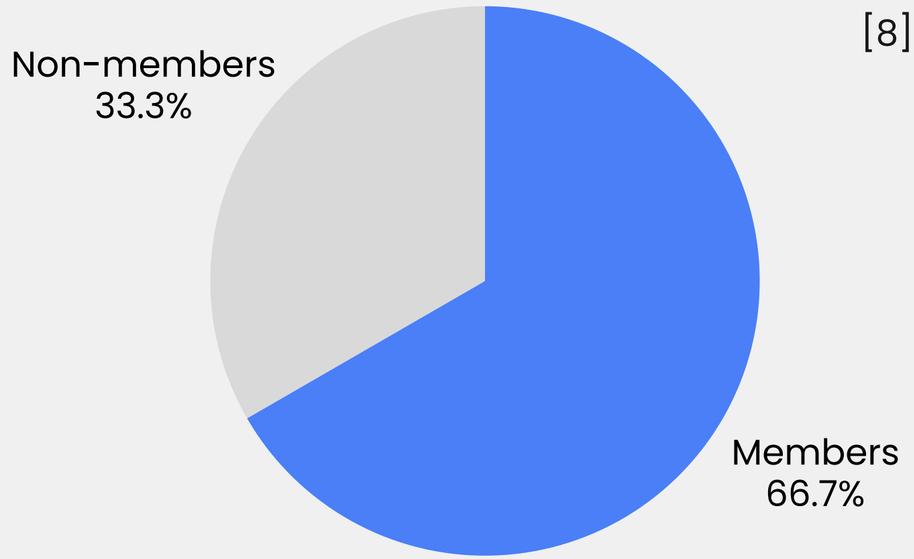
CUSTOMER SATISFACTION & OR

What hotel experiences have made you want to return to the same hotel?

34 responses

Marriott's loyalty program and consistency in standards across countries

[8]



SATISFACTION GAPS

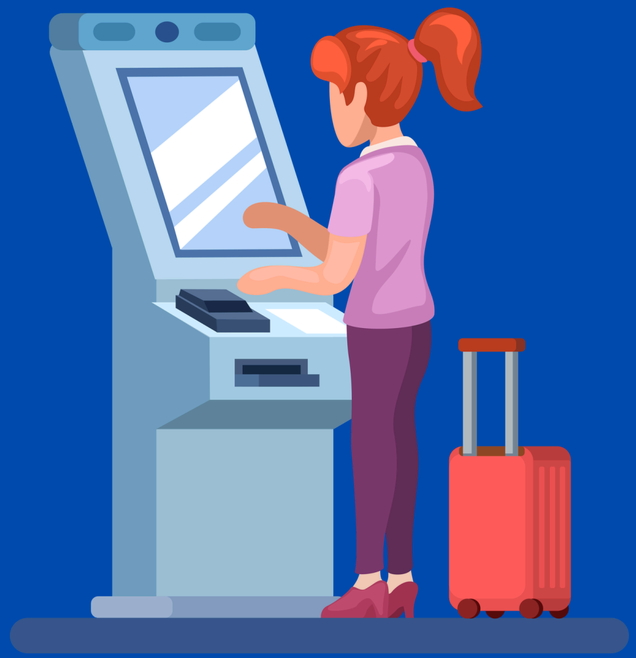
[1]

WHY IS IT STAGNANT?

Rising Expectations

Different people want different things [3]

Automation Friction



Scaling leads to standardization [7]

DESIGN CHALLENGE

Revenue/Available Room (RevPAR)

Service Quality

Customer Satisfaction

PERSONALIZATION

ALL ROADS LEAD TO PERSONALIZATION!

86% [4]

of travelers sought at least 1 aspect of their experience to be personalized

61% [2]

of consumers are willing to spend more for personalized experiences

87%

of guests are more likely to recommend a hotel if they receive a personalized experience

GM of Luxury Hotel

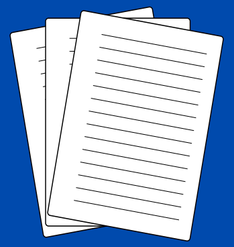
- Impact of personlization is seen when guests keep coming back
- Which guests do we upsell to?
- We want to know guests' coffee orders, room settings, and more

PERSONALIZATION IN PRACTICE

Accor Customer Digital Card (ACDC) System

GM retrieves data from database

Morning Brief



Hardcopy notes handed to staff as fallback

Service based on information from morning brief and profile

Update customer data into database by staff

GUEST JOURNEY

Single source retrieval of data, forgotten informtation needs to be lookup via hard copy

+

Hard to find information and miss on information of guest, inability to sometimes identify the guest from worded descriptions and pictures

Hard to refer during conversations and reference to notes breaks eye contact and reduce professionalism

+

Hard for staff to maintain natural flow of conversation while asking critical questions to gather data for future personalisation

Every staff have their own interpretation of data and own phrasing of new knowledge into database

+

Staff are busy and only entry on free time, information may be lost or corrupted with time

GUEST JOURNEY

What is needed?

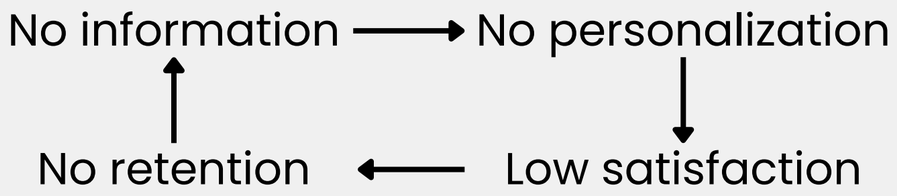
Lack of seemless recognition of guest and ease of finding and filtering information	**Recognition and fast retrieval of information**
Lack of infomation retrieval with conversation and difficulty in asking questions to gather data from customers	**Ease of referencing information while maintaining professionalism**
Lack of effortless data entry, with consistent formats and accurate data input into system	**Easy data input and reliable processing into standardised useful information**

THE CHICKEN-EGG PROBLEM

Frequent Guest

- Guest profile
- Rewards
- Established rapport

New Guest



FIRST-TIME GUESTS

GM of Luxury Hotel

Single digit retention rate, lots of first time guests

DESIGN CHALLENGE

How might we to enable luxury hotel staff to **capture, share and access relevant guest information seamlessly**, so they can deliver **consistently personalized, high-quality service.**

OBJECTIVE

Help staff capture and share relevant information, especially for first-time guests, improving service quality.

IMPORTANT FUNCTIONS

Targeted at the problems faced for First-Time Guest
Capture the interaction, process and extract information, then display what matters now.

CAPTURE (+ PROCESS)

01 Capture preferences/complains of guests

02 Associate the interaction with the guest

03 Process and store information for easy lookup

Time-stamped interaction + guest context

Supports timely, complete capture

DISPLAY

01 Select information for the current service task

02 Rank by location, task and urgency

03 Choose concise visuals, rendered with low latency

Short, actionable glasses cue

Supports relevance, discretion and speed

Capture and Process protect completeness and accuracy; Display carries relevance, low distraction and latency.

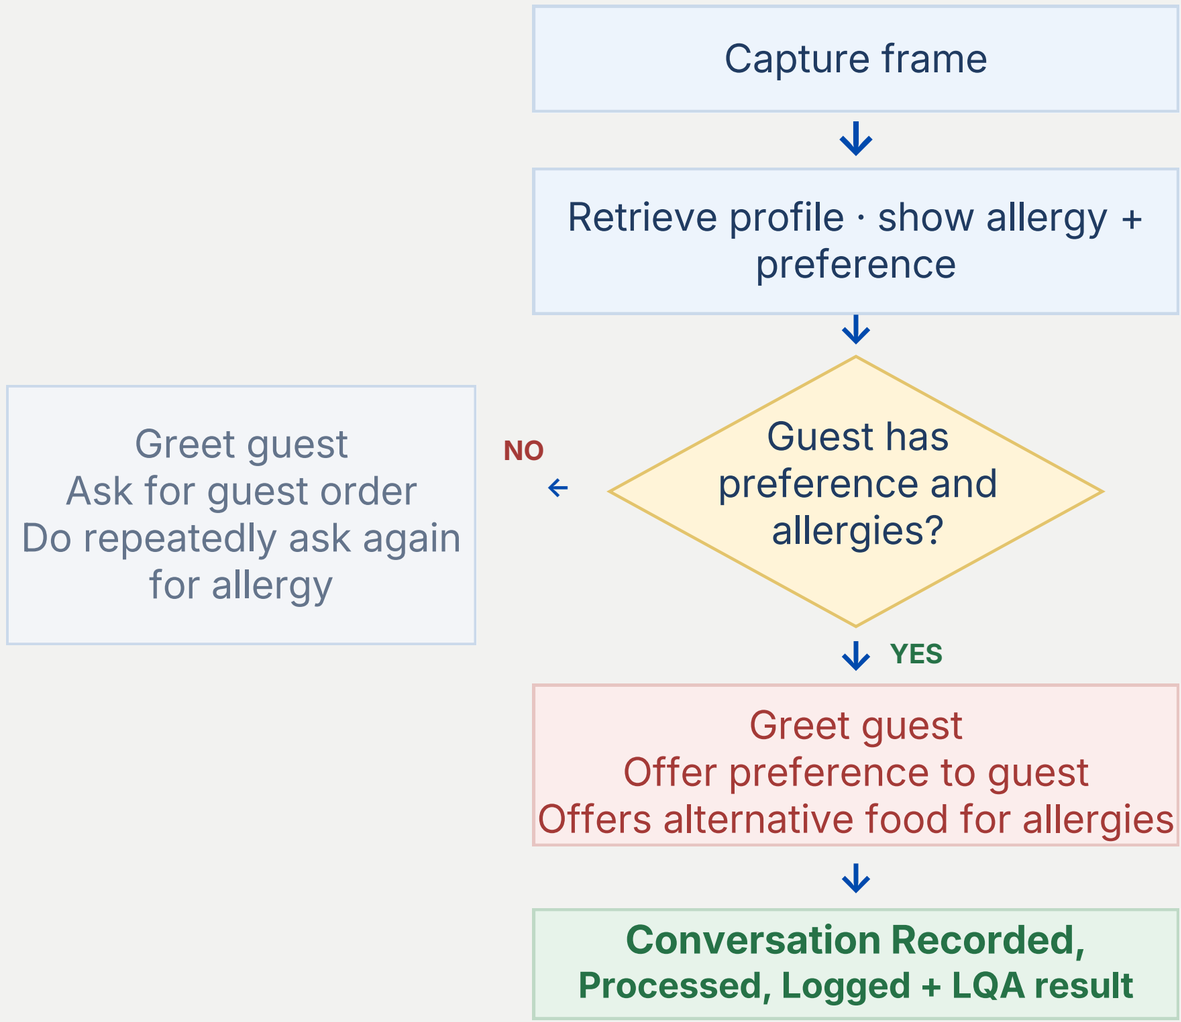
DESIGN CRITERIA FOR THE SERVICE

Functions	Criterion	Targeted LQA Service standard	Design Requirement	How to measure
Display	**On-time service support**	Greet within 1 minute; offer a drinks order within 3 minutes.	Show the useful cue promptly so staff can act within the service window.	Time first interaction to first visible cue (<1s) [13]
	Glanceable interaction	Natural, friendly engagement; Discreet name use;	Show a concise cue that staff can understand while speaking	Correct understanding Glance duration Attention shifts
Capture	**Low-effort capture**	Active listening and natural, friendly engagement.	Staff starts capture with a simple action.	Time spent capturing information
	Preference continuity	Allow confirmed preferences to personalise service	Capture a guest-stated preference, make available for the next shift.	Correct preference reaches the next staff member

MORPHOLOGICAL MATRIX

Functions	Criterion	Manual profile + phone (Current)	Smart glasses	Audio badge + earpiece
Display	**On-time service support**	Staff remember customer based on memory	Computer vision to identify	Staff remember customer based on memory
	Glanceable interaction	Manual identify customer Open the profile on a phone/paper	Glanceable glasses cue	Short audio cue in earpiece
Capture	**Low-effort capture**	Manual identify customer + Write after conversation	Camera identify customer + Hands-free audio capture	Manual identify customer + Hands-free audio
	Preference continuity	Staff input customer and record to backend manually	Customer and record automatically processed in server	Staff input customer and record processed in server

PROPOSED STAFF JOURNEY



VISUALIZATION

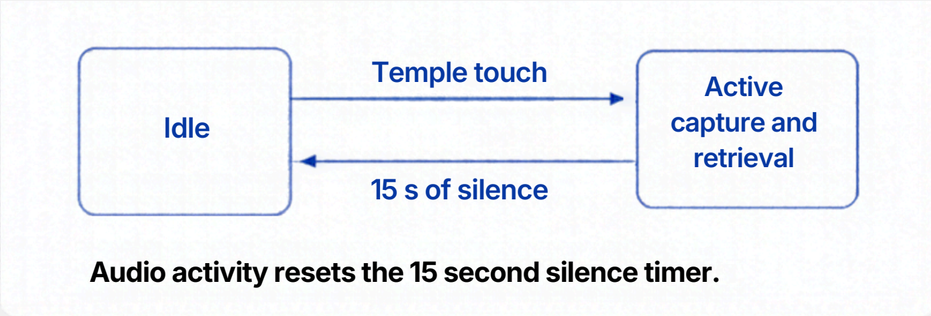
CAPTURE

Requirement and rationale

Capture preferences of guests easily to keep interaction with guests natural

CAPTURE PIPELINE

Iteration 1: Continuous to Temple Touch Activation



Evaluation Method

20 minutes of total run time, with 1 minute of conversation every 5 minutes

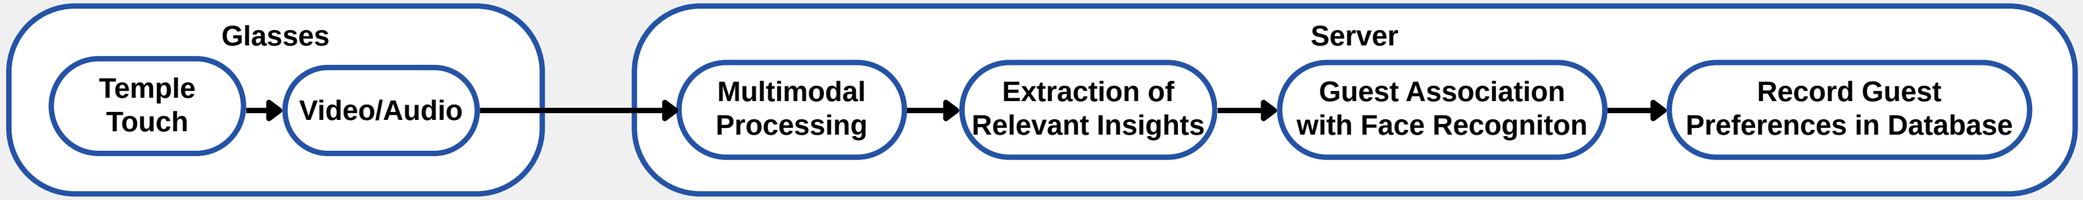
Method	Duty Cycle	Traffic	Battery Lost
Continuous	100%	705	28%
Temple Touch	25%	170	9%

OUTCOME

67% Power Reduction

CAPTURE

Iteration 2: Local to Server Processing



OUTCOME

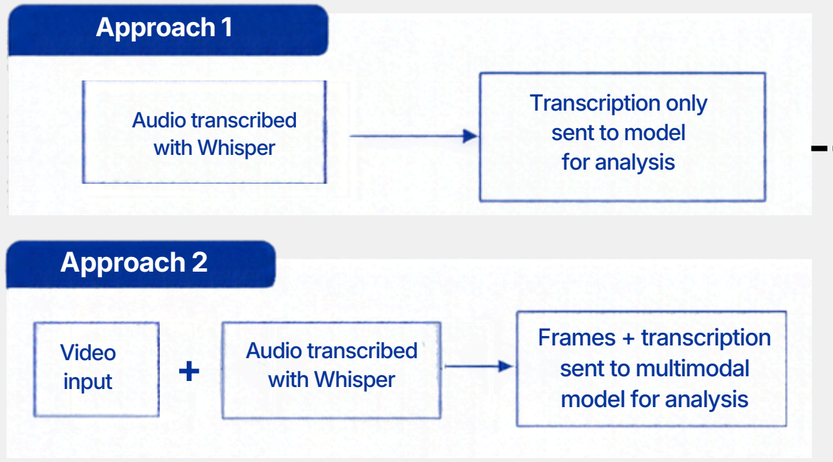
30% reduction in processing time from **1.69s** to **1.18s**

Better battery performance

Evaluation Method

Average timing across 15 runs, from temple touch to seeing displayed information

Proposed Evaluation and Iteration for Preference Extraction:



1 CONVERSATION TRANSCRIPT

Example:

1. Guest: "I usually have oat milk."
2. Guest: "The no-sugar drink I ordered is too sweet.

2 EXTRACT TO JSON

category, value, evidence_quote, record_scope, verification_status

Evaluation Method

Use short staged clips, containing explicit preferences, requests, corrections, multiple speakers and visual-only observations, to measure the precision and recall of the two approaches from the extracted preferences.

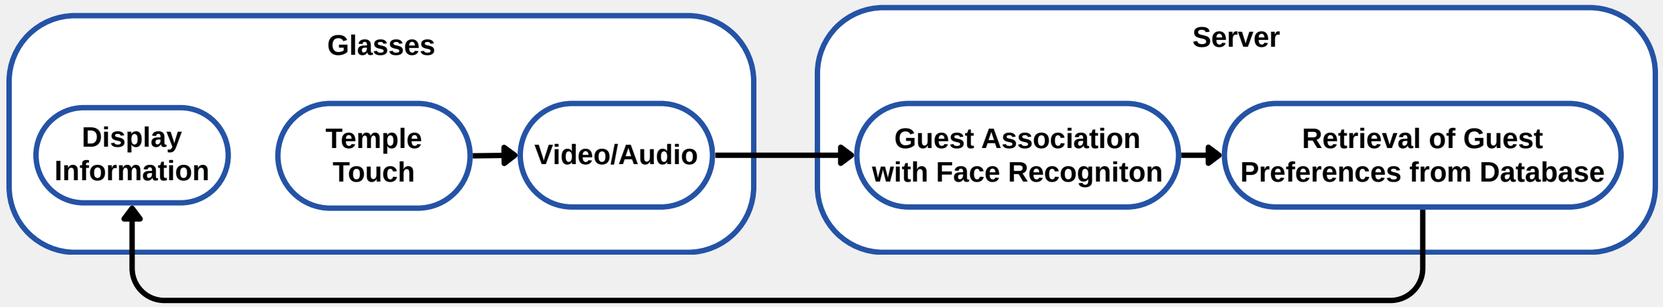
Local model	Facts matched	Mean sec / transcript
llama3.2:3b	1/3	76.1 s
qwen3:4b-instruct	2/3	67.2 s
gemma4:e2b	2/3	86.4 s

DISPLAY

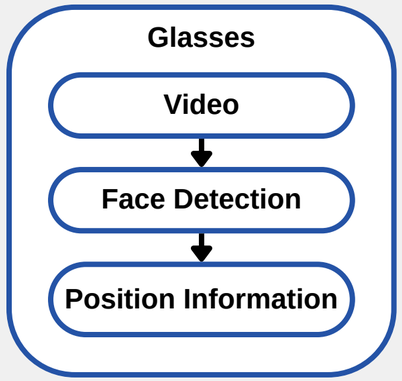
Requirement and rationale

Displayed information must be at a natural position for staff to maintain eye contact

DISPLAY PIPELINE



Iteration 1: Detect Face Position



OUTCOME

Stable placement near the guest interaction area

Supports natural eye contact

Clear visuals without covering the face

DISPLAY

Requirement and rationale

Displayed information must be concise to prevent information overload

ITERATION 2: CONTENT

MAIN SYMBOLS

MARKERS

OUTCOME

Simplified display with familiar icons

Short labels and brief or on-demand views

Less clutter and fewer distractions

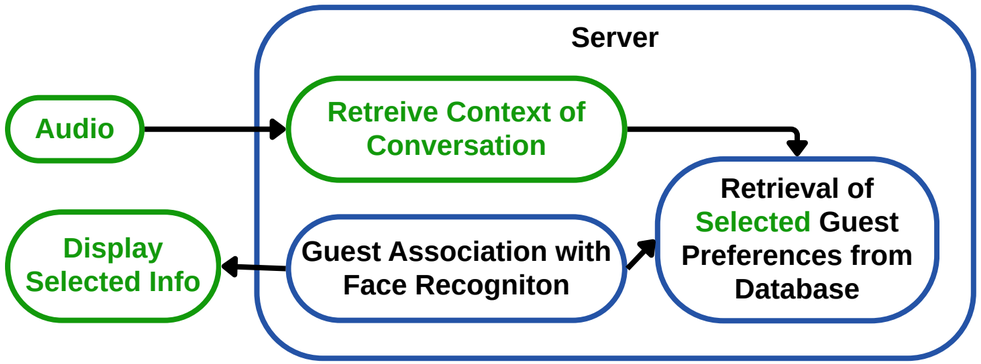
DISPLAY

Requirement and rationale

Displayed information must be at a natural position for staff to maintain eye contact

PROPOSED ITERATION: CONTEXT

PIPELINE (SERVER)



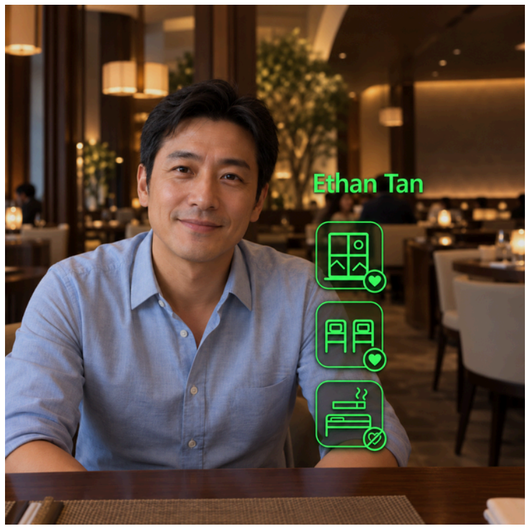
OUTCOME

Shows only what matters in the moment

Example: dining preference at meal service

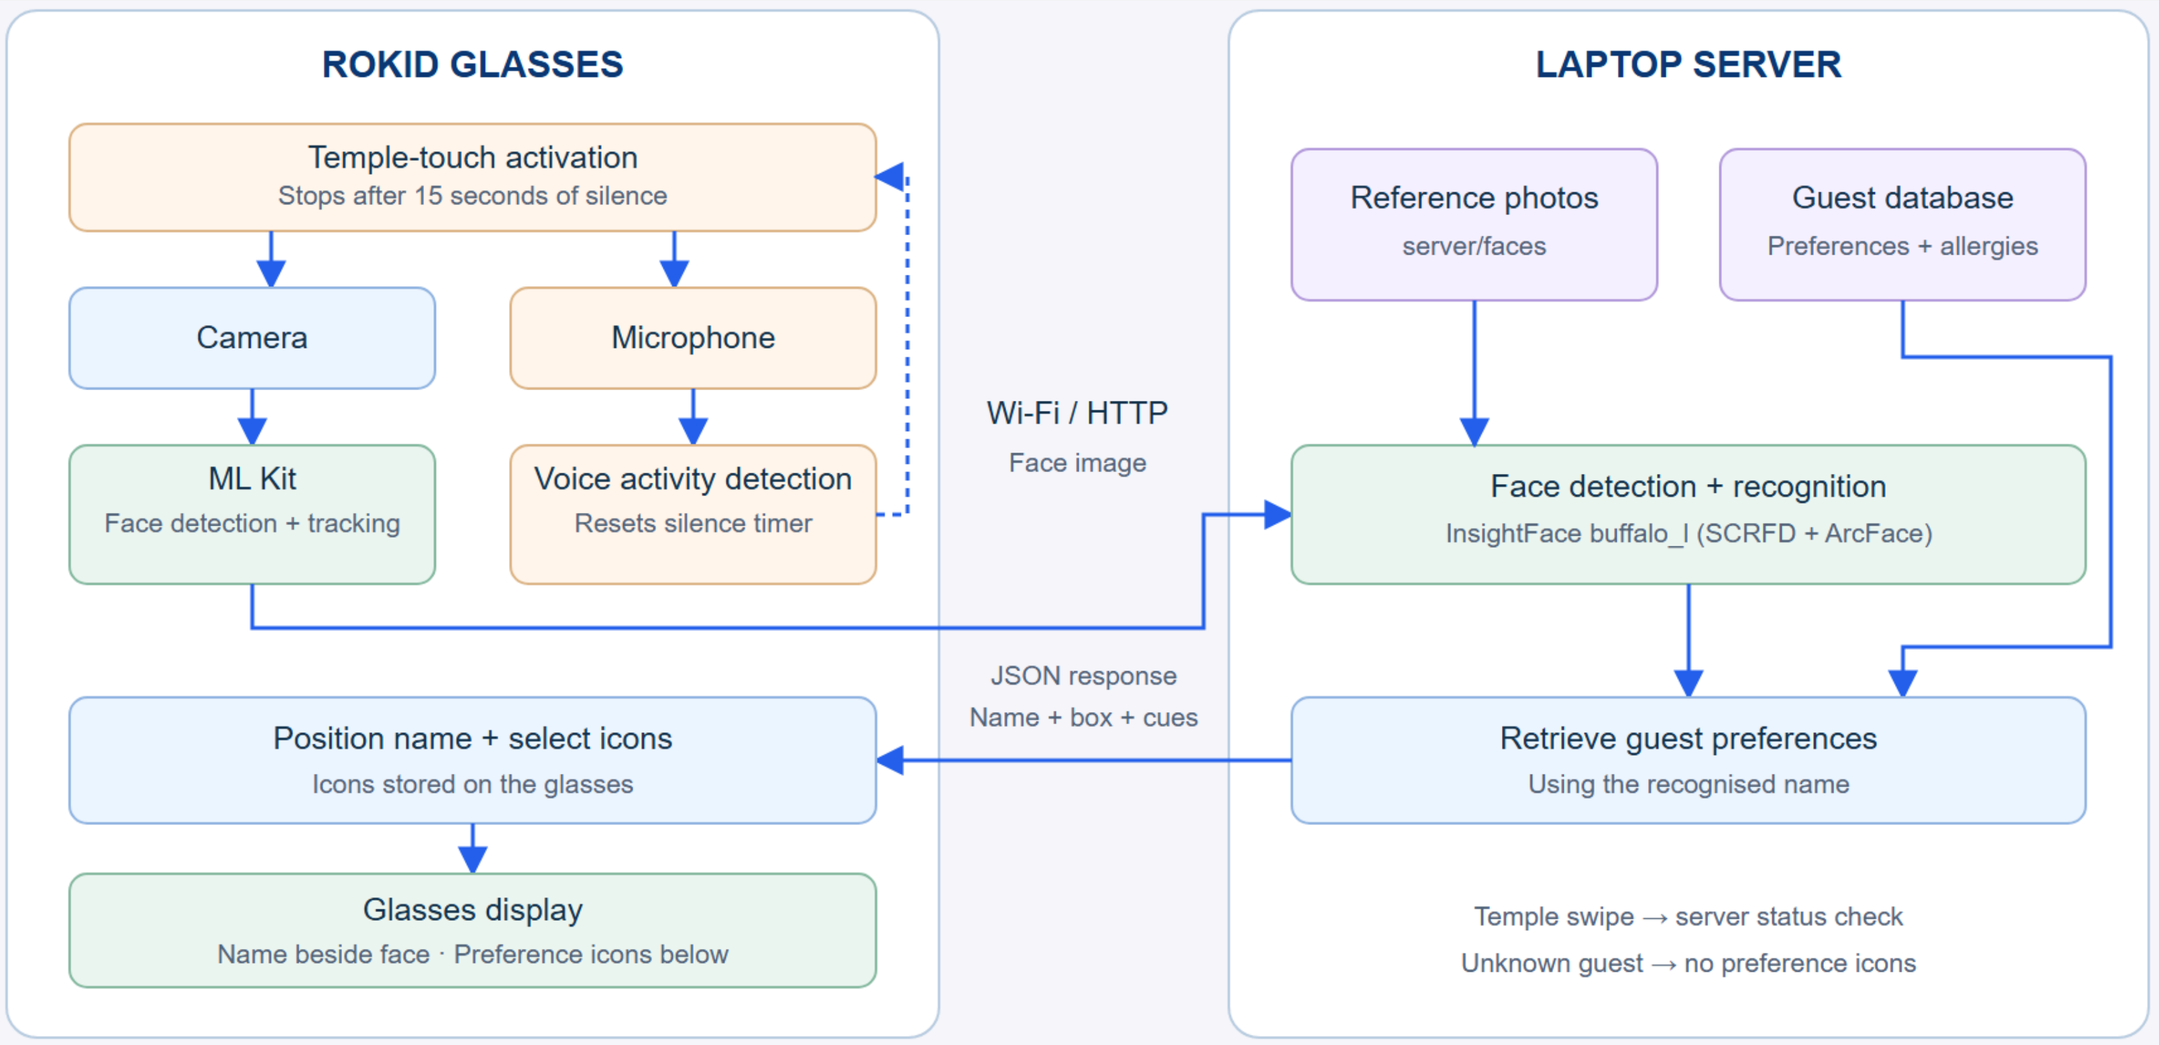
Less information overload

Before



After

SIMPLIFIED SYSTEM ARCHITECTURE



USER VALIDATION

VALIDATION SETTING

Concept walkthrough and product testing with 10 people (non-hotel staff) to evaluate current prototype

Question 1: Is it easy to start the capturing/displaying process?

All participants mentioned that it is easy.

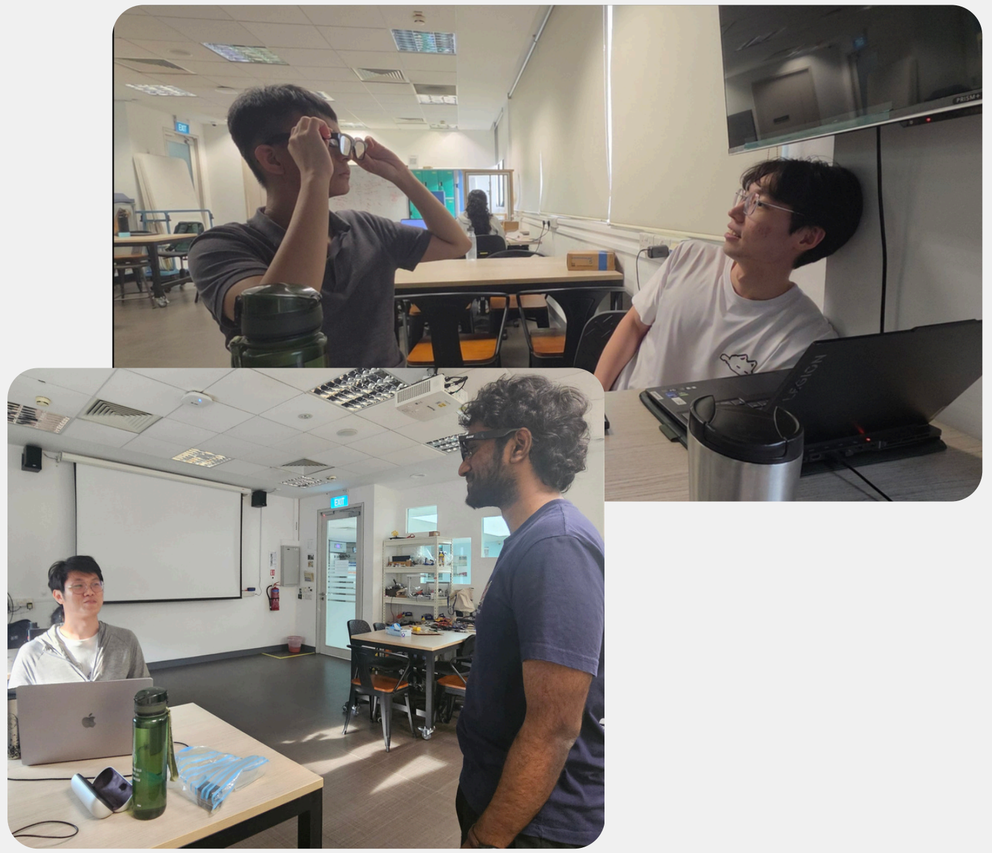
Question 2: Will the cues help you to serve guests better?

Most participants (70%) mentioned that they can see how the cues could be helpful. However, some found that the icons displayed have no relevance to the conversation they are having, which will be accounted in our next step.

Question 3: Are you able to use the cues naturally?

Most participants said that a quick glance is sufficient for them to get the cues, but they found it challenging to incorporate them into conversations naturally.

This could be better tested with actual staff testing, but regardless, it might indicate a need for staff training.



DESIGN REQUIREMENTS CHECK

DESIGN REQUIREMENT	TARGET	MEASURED RESULT	STATUS
On-time service support	Show useful cues **<1s** so staff can act within the service window.	**1.18s**	Low-effort capture	Staff starts capture with a **simple action**, with minimal interruptions during a conversation.	**Single temple tap** to capture and it continues till conversation ends automatically.	
Glanceable interaction	Show a **concise cue** that staff can understand while speaking, without reading a full profile.	**70%** of participants only requires a quick glance but find it **hard to incorporate** it in conversations naturally, leading to occassional pauses and attention shifts.	Preference continuity	Capture a guest-stated preference, let staff confirm it, then make it **available for the next relevant interaction or shift**.	**Shared database** allows all staff to receive updated information **However** preference and information currently not extracted consistently	
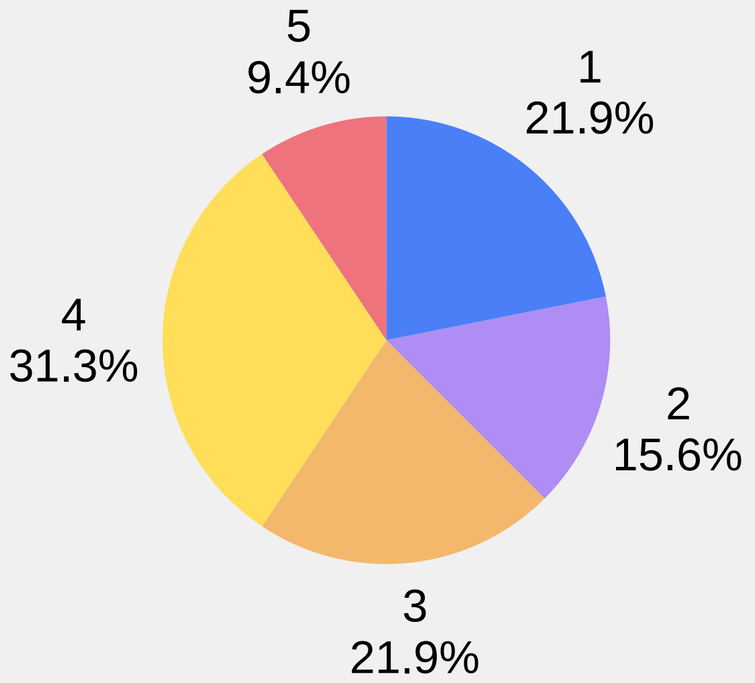
LIMITATIONS

PDPA Concerns

Collection and retention of guest insights requires guest consent, as required by Singapore's PDPA data-protection act. Furthermore, guest have to be comfortable with guests wearing smart glasses.

How comfortable would you be if hotels took note of your preferences and stored them for better service (1: least, 5:most)?



>40%

of guests are willing (rated >4/5) for hotels to collect and store their data, such as facial images, preferences and purchase history.

NEXT STEPS

Main Points

- Refine preference extraction and implement contextual retrieval of preference.
- Hotel staff usability pilot: Identify need for staff training, or cues for staff to ask guiding questions to capture preferences.
- Implement LQA scoring for each staff to ensure they adhere to standards and perform service recovery if needed.

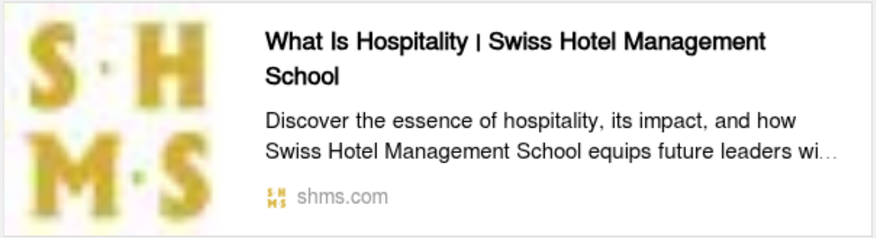
APPENDIX

WHAT IS HOSPITALITY?



- making others feel valued and welcome

GUEST SURVEY

What hotel experiences have made you want to return to the same hotel?

38 responses

- Hospitality
- Breakfast buffet, gym, pool
- Having good food options, hospitality, and amenities (gym, pool, etc.)
- Ambience, room size and complementary breakfast spread
- Hospitality, cleanliness, view if vacation, Accessibility during work. Amenities
- Cleanliness and courteous service
- Cleanliness, service, activities
- Room Cleanliness, Cost
- Cleanliness

What does a personalized hotel experience mean to you?

38 responses

- Something I get to choose about my stay
- A personalized hotel experience would make me feel comfortable and welcome in the hotel.
- Offering flexible check-in and check- out time to cater to guests schedule.
  Provide a minibar with complementary snacks and beverages based on the guests liking
- A personalized hotel experience means feeling welcomed and valued as an individual. It includes understanding guests' preferences, offering customized services, paying attention to their needs, and making them feel comfortable and at home throughout their stay.
- Greetings you by name, Maybe arranging for your favourite food
- Service what I want, the way I want, when I want
- Swift no waiting in and out with minimal time and interaction
- Homely environment

GUEST SURVEY

Would you like staff to anticipate your preferences based on your previous stays?

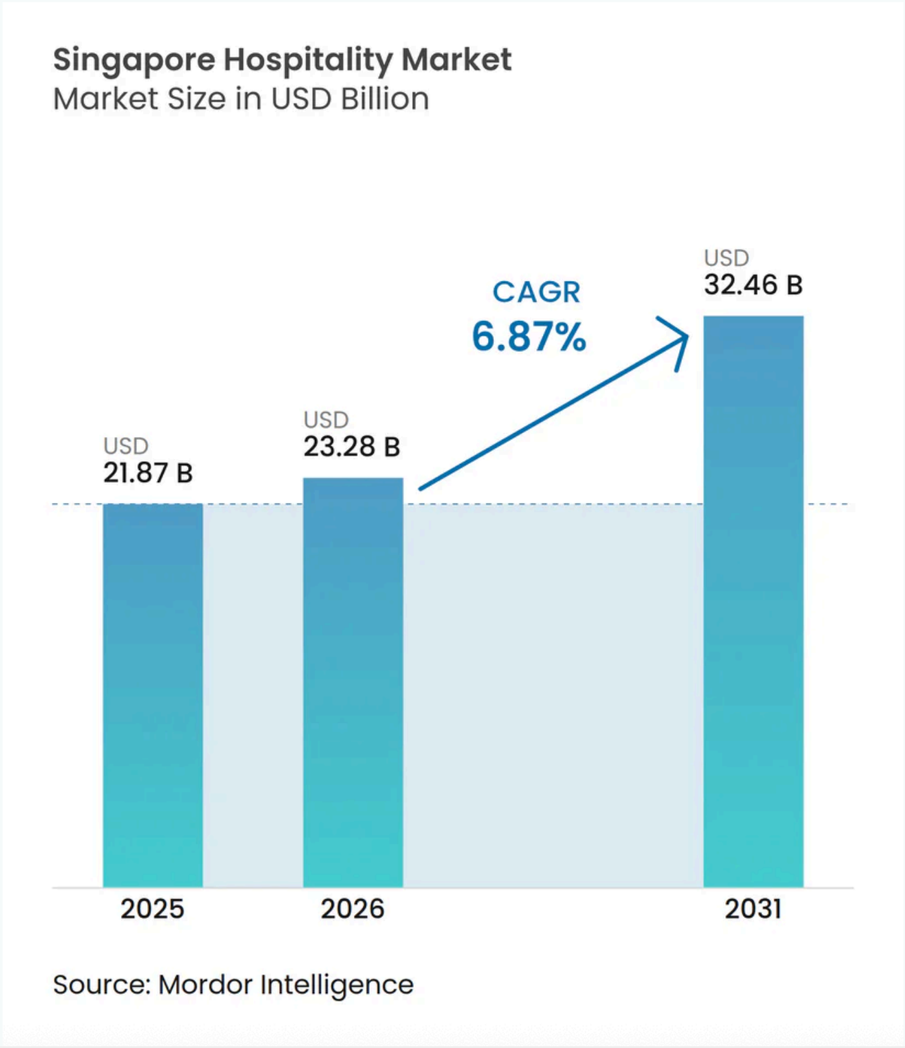
HOSPITALITY MARKET IN SG

[13][14]

Market Overview



“Staff miss emotional cues right in front of them because they’re overwhelmed with other tasks.”

“Shortage in manpower, particularly in the front office, housekeeping, and F&B divisions.”

MANPOWER

“It’s challenging to address customer preferences because of the manpower shortage.”

“Staff are shared across postings when there are shortages in different divisions.”

“Time taken to finish the check-in process is a KPI.”

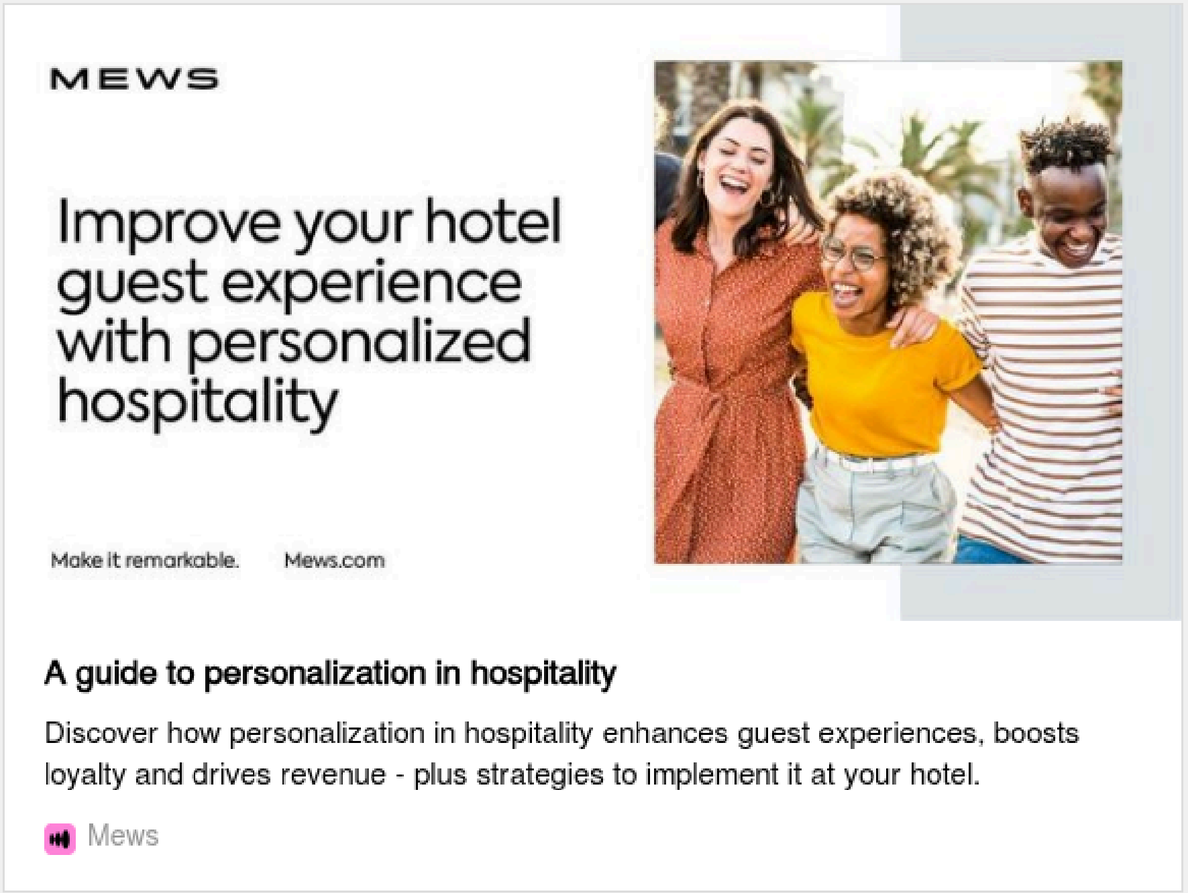
MANPOWER

Hotel growth faces 1.4% hit from labour shortage

Singapore's hotel industry needs to free its employees from routine tasks through technology, as the city-state faces a labour shortage.

Singapore Business Review / Jan 15

OPERATIONAL EFFICIENCY



- personalization reduces friction, smoother operations

COGNITIVE OVERLOAD

Why Cognitive Intelligence is the New Core Competency for Hospitality Managers?

Dr Charalampos (Babis) Giousmpasoglou, Bournemouth University Business School Why Cognitive Intelligence Matters Hospitality has always been a people-centred business, shaped by the subtlety of human interactions and the quality of emotion…

Hospitality & Catering News / Dec 14, 2025

Under Pressure: How Hotel Stressors Shape Employees' Mental Health

Research of 756 hotel employees reveals poor leadership and job insecurity as top stressors, with front-of-house staff showing better mental health despite heavier workloads.

Hospitality Net / Mar 24

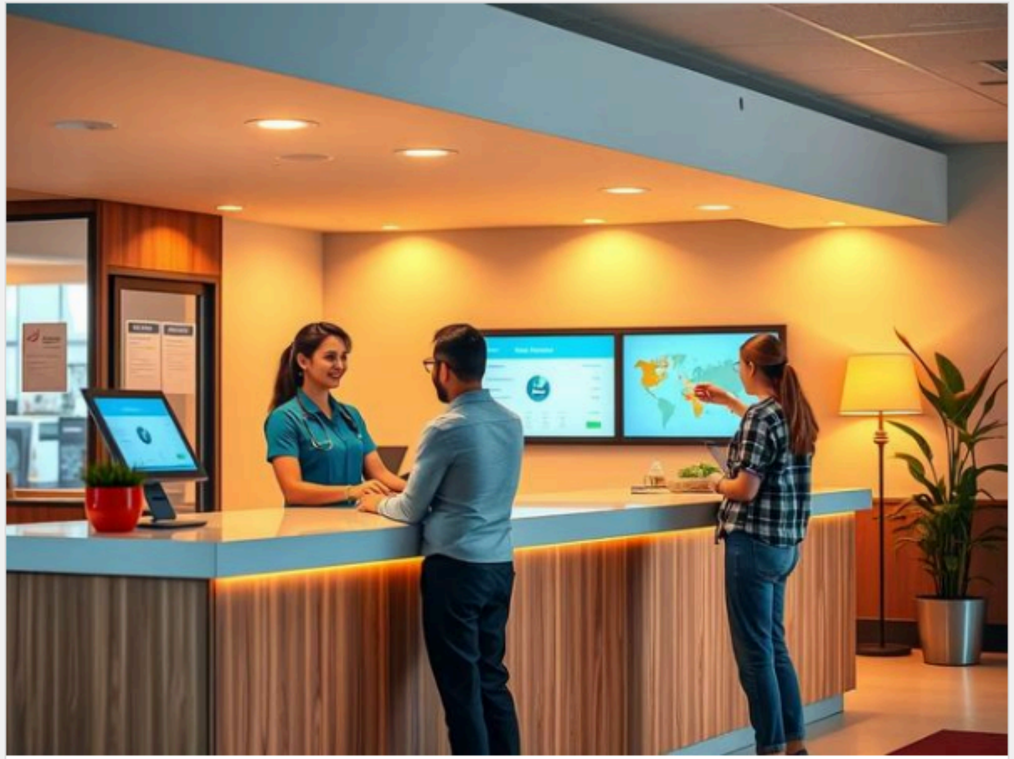
THE NARE CASE STUDY

The Nare and RMS: Personalization so good, 30% of guests rebook before they even leave

Perched above Carne Beach on Cornwall's Roseland Peninsula, The Nare is a five-star country house hotel where handwritten letters still matter, dogs have their own menus, and guests are remembered by name. A proud member of Pride of Britain...

Hotel Tech Report

GUEST RECOGNITION

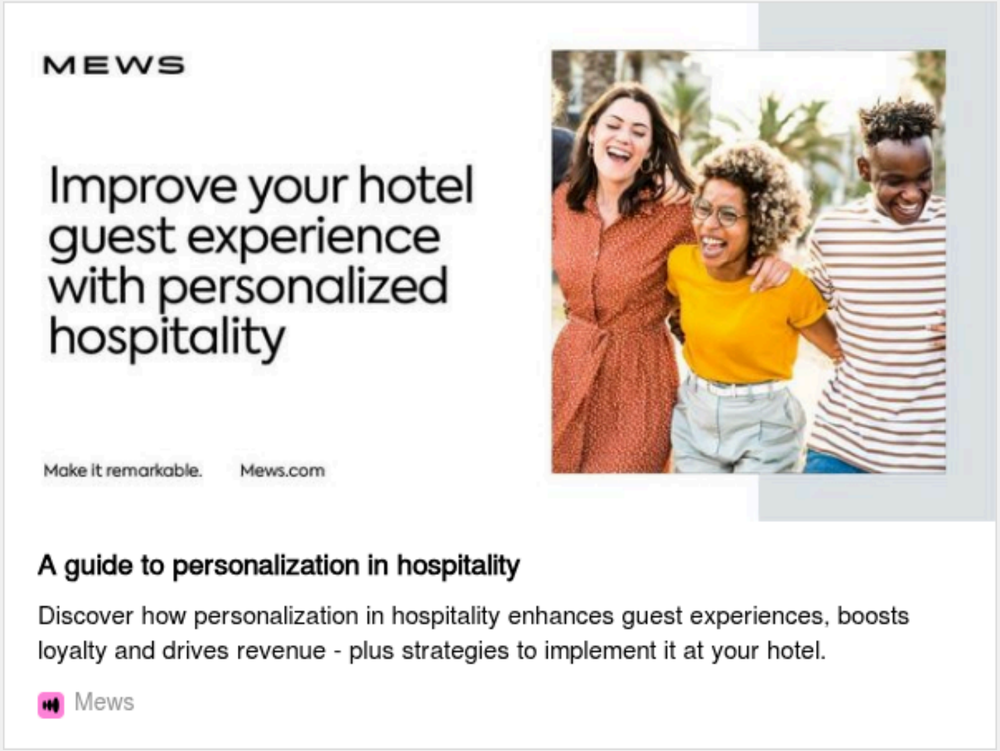


The Importance of Guest Recognition in Hospitality

Hospitality has always been about making guests feel welcome, but today's travelers expect more than a warm smile—they want to feel truly seen.

Upper Delaware Inn / Jun 1, 2025

PERSONALIZATION AT CHECK-IN



- targeted upsells and customized packages convert better because they align with guest preferences

DATA SILOS

How hyper-personalization can elevate the hotel guest experience

As technology transforms hospitality, one thing is clear: Data-driven personalization is no longer optional, writes Saurabh Goel, VP at Astound Digital.

Hotel Dive / Mar 9

- guest preferences are scattered across departments

INSTITUTIONAL KNOWLEDGE LOSS

Iframely could not fetch the given URL.
Click here to visit the page.

- “One of the biggest risks for luxury hotels is that their best service intelligence still lives in people’s heads: the concierge who knows how to read a returning guest, the restaurant manager who remembers family preferences, the housekeeper who notices quiet details, the front office leader who knows how to recover a delicate complaint.”

HUMAN CONNECTION

- when we scale systems to increase operational efficiency, we end up with standardization

CURRENT GAPS

Observation

Data Stored

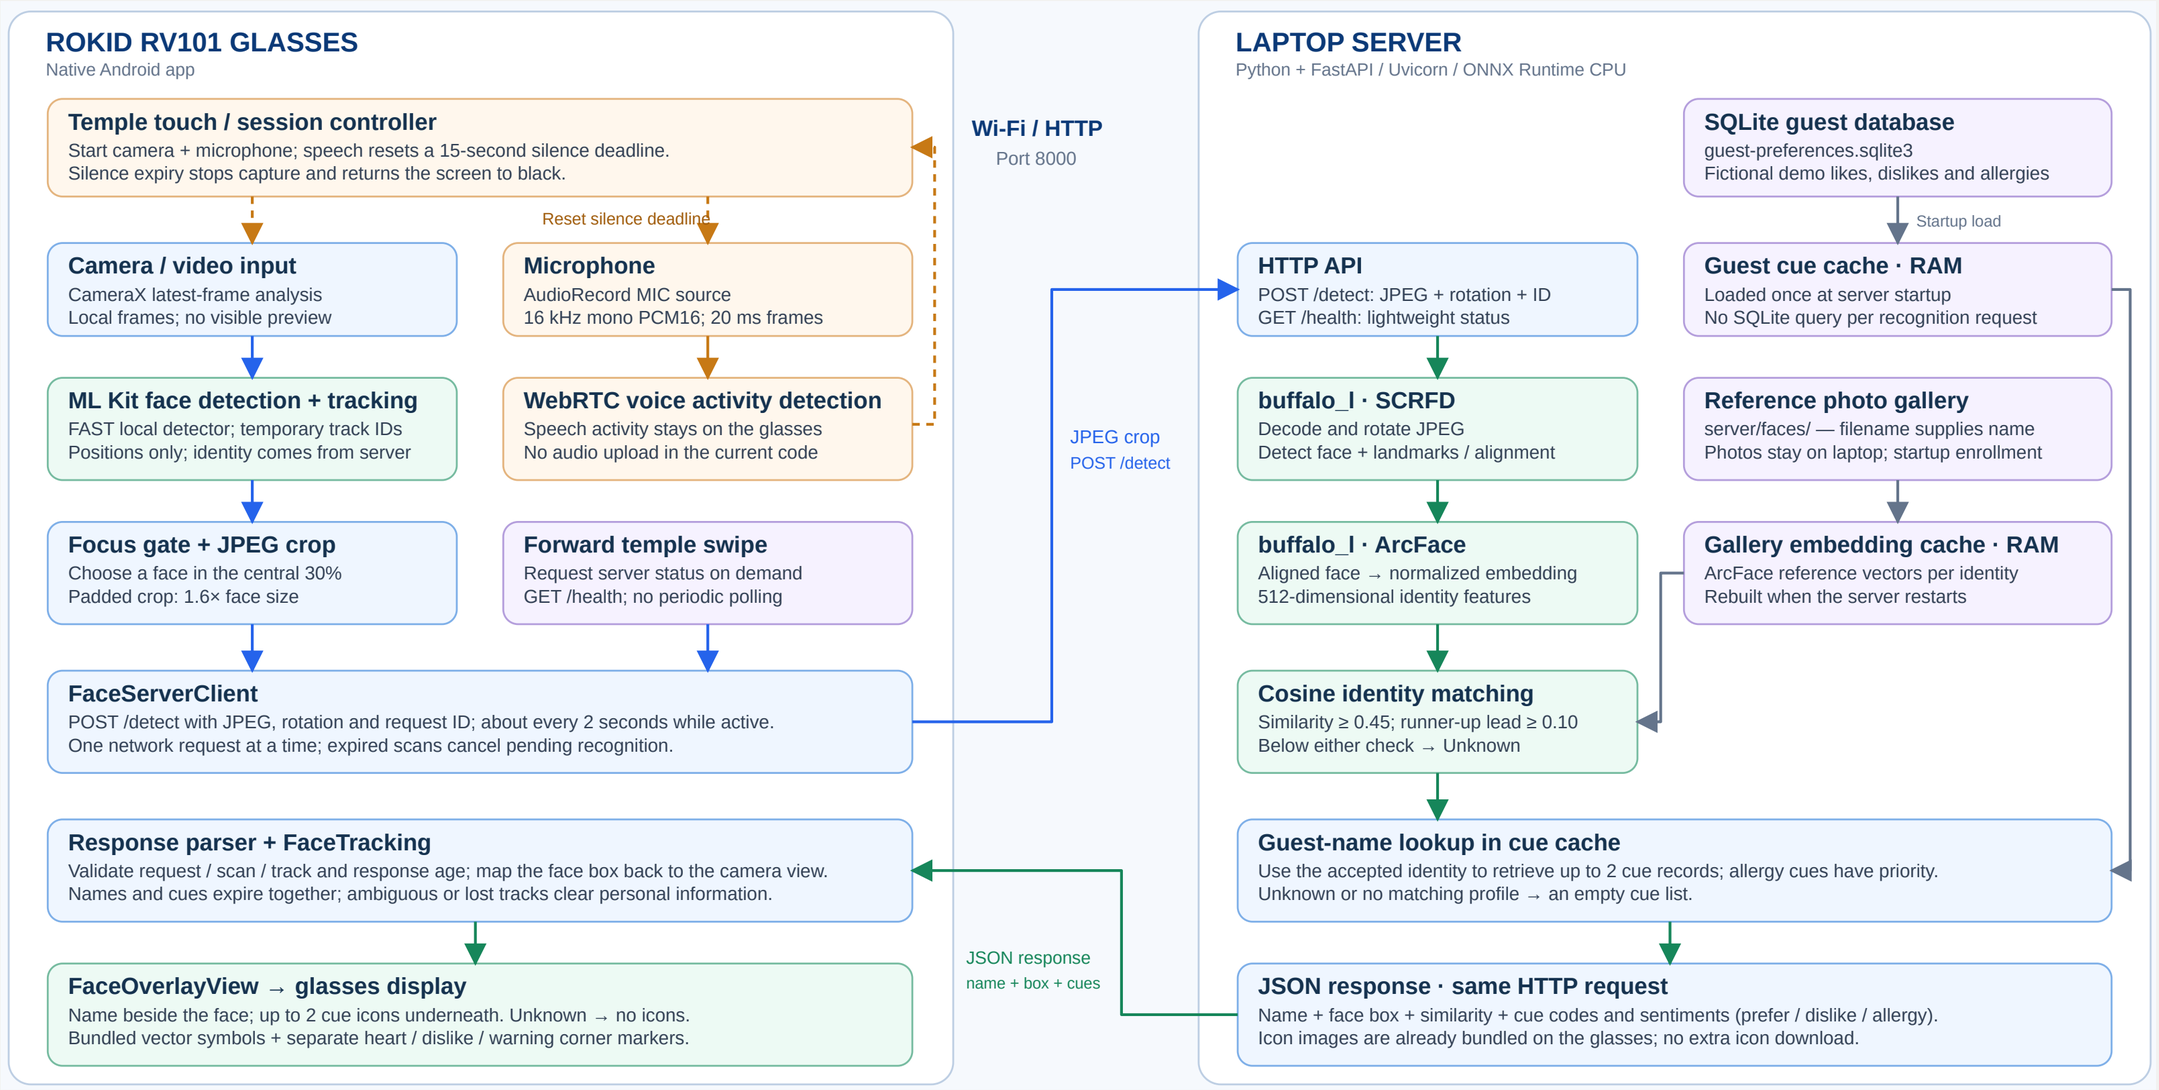
Preferences

- Manpower shortages
  - Cognitive overload
- Fragmented data
- High staff turnover rate
  - Institutional knowledge loss
- Miss emotional cues
  - Lose interpersonal connection

SAMPLE LQA

SALES OPPORTUNITY	Did the employee offer the option to order food or supply a restaurant menu?
EI BEHAVIORAL	ANTICIPATE - Was service anticipatory/intuitive with the employee thinking ahead to act on future needs/opportunities of the guest?
SERVICE	Did the employee show excellent product knowledge when taking the order and promote local/signature drinks, where applicable?
SERVICE	Was the employee able to accommodate any reasonable off menu requests, or custom drink orders?
SALES OPPORTUNITY	Did the employee offer a choice of brand/variety when taking the drink order if there was an opportunity to do so?
SERVICE	Was the employee able to answer any questions with regard to the menu, its ingredients and allergies, where applicable?
EFFICIENCY	Did the employee obtain a full and complete order (i.e. cooking instructions, accompaniments etc.)?
SERVICE	If special dietary requirements were provided at any point during the stay, were they discreetly re-confirmed?
EI BEHAVIORAL	CLARITY - Was the employee's speech clear and use of English satisfactory, enabling engagement in two-way conversation with the guest?
EI BEHAVIORAL	ENGAGEMENT - Did the employees engage in a well-paced, natural (non-scripted, jargon/slang free), friendly and interested manner?
EI BEHAVIORAL	GUEST'S NAME - Did the employee use the guest's name naturally and discreetly without overusing it?
EI BEHAVIORAL	EFFORT - Did the employee make every effort to meet the guest's requests or offer a suitable alternative?
EI BEHAVIORAL	PERSONALIZATION - Did an employee personalize the interaction in any way and engage the guest as an individual?
EI BEHAVIORAL	ACTIVE LISTENING - Did the employee actively listen, seek clarity if required, avoid interrupting and give the guest their undivided attention (i.e. the guest should not have to repeat the request)?
EI BEHAVIORAL	EMPATHY - Where applicable, did the employee display self-control and empathy in challenging interactions and offer a suitable alternative/resolution?

FULL SYSTEM ARCHITECTURE



TEST DATA AND RESULTS

Two synthetic, speaker-labelled conversations; guest-information extraction only.

CHAT 1 · PREFERENCE + CUSTOM ORDER

Guest: “I usually have oat milk. Could I have a decaf flat white?”

EXPECTED EXTRACTION

food_or_drink_preference → oat milk
Quote: “I usually have oat milk.” · profile_candidate

CHAT 2 · COMPLAINT + DIETARY DETAIL

Guest: “The no-sugar drink I ordered is too sweet. Could you fix it? I also have a peanut allergy. Is this dessert safe?”

EXPECTED EXTRACTIONS

complaint → “too sweet” · interaction_note
dietary_detail → “peanut allergy” · profile_candidate

MODEL RESULTS

Local model	JSON valid	Facts matched*	Mean sec / transcript
llama3.2:3b	2/2	1/3	76.1 s
qwen3:4b-instruct	2/2	2/3	67.2 s
gemma4:e2b	**2/2**	**2/3**	**86.4 s**

*Match = expected category + phrase. Each model saw 2 chats. Times are means over those text calls; Whisper excluded. All 6 calls returned schema-valid JSON.

OBSERVED ERRORS + NEXT ITERATION

Llama: oat milk miscategorised; complaint missed.
Qwen: complaint captured as “Could you fix it?”
Gemma: “too sweet” classed as preference; safety question as dietary detail.

NEXT
1. Rerun with an extraction-only prompt; the baseline used a combined task prompt.
2. Add labelled positives, ambiguous cases and examples that should produce no note.
3. Measure precision/recall, category/scope accuracy, quote support, repeatability (3 runs) and p50/p95 latency.
4. Add Whisper later; score transcription and speaker attribution separately.

CONVERSATION TO GUEST INFORMATION

Extract explicit guest statements into reviewable, quote-grounded JSON.

1 CONVERSATION TRANSCRIPT

2 synthetic chats with guest/staff turns labelled.

Example: “Guest: I usually have oat milk.”

Current input is text; Whisper/audio is not connected.

2 EXTRACT TO JSON

Example output shape

```
{
  "category": "food_or_drink_preference",
  "value": "oat milk",
  "evidence_quote": "I usually have oat milk.",
  "record_scope": "profile_candidate",
  "verification_status": "unverified_guest_statement"
}
```

3 CHECK + REVIEW

Python checks that the quote belongs to a guest turn and the value appears in that quote.

Classifies preferences, dietary details, requests, complaints and occasions.

Draft stays unverified and pending review; nothing is saved.

WHAT THE TESTS FOUND

Initial model-only baseline · 2 synthetic chats · 3 expected guest facts

Local model	Guest facts matched*
llama3.2:3b	1/3
qwen3:4b-instruct	2/3
gemma4:e2b	**2/3**

*Match requires both the expected category and phrase.

Observed: missed or mislabelled oat-milk preference; “too sweet” complaint was missed or miscategorised; dessert-safety question misclassified.

LIMITATIONS -> ITERATE

Now: small synthetic set, text-only input, category/value errors; no approved guest record is written.

NEXT
1. Build reviewer-labelled, held-out conversations with preferences, allergies, requests, complaints, occasions and ambiguous phrasing.
2. Change one prompt or extraction rule per loop; keep a regression set.
3. Replay each case 3x; measure fact recall, category accuracy, quote support and repeatability.
4. Add Whisper after text extraction stabilises; measure transcript and speaker-label errors separately.

Exploratory synthetic text baseline (2026-11-03); not real guest data. Captured statements remain unverified and require staff review.

COMPETITOR ANALYSIS

Existing products cover different parts of the guest information workflow.

ORACLE OPERA CLOUD

Profile notes and preferences can be viewed or managed through staff workflows.

HOTELKIT

Digital handovers, team communication, guest requests and complaints.

ALLIANTS CORE

Connects guest context across systems, including visitors and restaurant patrons.

SOFTSERVE FACE ID

A hands-free AR face-ID demo lists hospitality as a use case.

COMPLETE WORKFLOWS

A · Profile note + phone lookup

Uses existing hotel records.
Trade-off: staff must search at the service moment.

B · Phone capture + glasses cue

Adds a checked guest-approved note, then tests hands-free retrieval.
Trade-off: integration and staff impact are unknown.

C · Glasses match only

Tests automatic access to existing profile context.
Trade-off: does not capture a new preference or hand it over.

CANDIDATE TO EVALUATE: B — it connects new preference capture to point-of-service access.
No comparable public prices: estimate device, integration, training and support with the hotel.

COMPETITOR LANDSCAPE COMPARISON

How does our concept compare against existing hospitality solutions?

Alternative	Documented capability	Service touchpoint	Fit to the lounge task
OPERA PMS + hotelkit	OPERA stores profile notes and preferences. hotelkit assigns guest requests/complaints and tracks follow-up.	OPERA profile lookup; hotelkit request follow-up.	Covers profile lookup and request handoff; Does not have interface for staff to look up information and data collection
Kiosks · Mews / Stayntouch	Self check-in/out; product options include guest identity checks.	Guest-led arrival or departure at a fixed station.	Supports arrival identity and self-service; the lounge task needs staff-facing context during service. Does not have interface for staff to look up information and data collection
Meta AI glasses **(and other out-of-box consumer AI glasses)**	Built-in Meta AI; DAT connects mobile apps to supported camera/audio and compatible displays. Ray-Ban Display also runs web apps.	Meta AI assistant or custom app; web apps are Ray-Ban Display only.	Allows for information shown through the meta glasses UI. No out-of-box OPERA or staff handoff. A hotel app/service must connect guest context across shifts. Does not allow for developers to use glasses hardware for edge computation.
Proposed · OPERA PMS + Rokid + local laptop	Staff-triggered audio/vision with an AI-prepared guest cue.	Guest identification and context display during lounge service.	Adds a staff-facing cue at the lounge service moment.

EXPLORING THE SOLUTION SPACE

How did we explore and select subsystem combinations?

Workflow step	Manual profile + phone	Audio badge + earpiece	Smart glasses (selected)	Design requirement
Capture	Staff writes after conversation	Staff triggers a short audio note	Staff-triggered audio + vision	Capture a brief note for a clear service purpose
Draft / check	Staff types and reviews note	AI draft; staff edits	AI draft; staff edits	Let staff review and correct the draft
Guest link	Find profile and confirm stay	Staff selects guest after capture	Staff confirms guest/stay; vision may assist	Confirm the guest and current stay before saving
Save / share	Existing profile or note	Shared note with an expiry rule	Stay-scoped note (proposed)	Use an authorised guest record and expiry
Retrieve	Open the profile on a phone	Short audio cue in earpiece	Glanceable glasses cue	Show relevant context without disrupting service

The glasses workflow combines staff-triggered capture, guest confirmation and glanceable retrieval.

WHAT WILL WE PERSONALISE, AND WHY?

Are there any other areas more important to personalise?

Personalise dietary needs, useful F&B preferences and open requests to support safe, personal and efficient service.

Guest context to personalise	Why it matters	LQA / Forbes 5 stars standards	Project evidence / data
Open requests & service recovery (issue, owner, next action, status)	Passing the issue and next step helps the next staff member follow through during the same stay.	LQA Efficiency: attentive, efficient service. Forbes Bar/Lounge Service: Efficiency and Graciousness, Thoughtfulness & Sense of Personalized Service.	PARKROYAL discussed earlier in-stay feedback. A Medallia survey of 1,749 U.S. hotel guests includes issue follow-up among recalled personalisation experiences.
Food allergies & dietary needs (peanut, shellfish, celiac, Halal, vegan)	Protects guests from unsuitable offers. Staff check the authoritative record and food item before service.	LQA Food Quality: culinary quality and menu-description adherence. Forbes Hotel Dining: Food & Beverage Quality.	PARKROYAL interview: allergy details can pass from the PMS to breakfast, yet may be missed or not acted on.
F&B preferences (coffee, sweetener, milk, wine)	Useful preferences help staff make personal offers with fewer repeated questions.	LQA Emotional Intelligence: personalisation and empathy. Forbes Bar/Lounge Service: Graciousness, Thoughtfulness & Sense of Personalized Service.	Novotel and PARKROYAL both include coffee, sweetener and breakfast-egg preferences.

CAPTURE

FUNCTION 1 · MORPHOLOGICAL CHART

Guest is asked at entry; these are alternative capture methods after that.

Green cells mark recommended choices; one per row.

Functions	gnagr	Smart glass	gragrgs
n-time service support	Laptop form: staff enters structured notes	**Smart glasses: hands-free audio + camera**	Wearable microphone: audio only
2 · Capture start trigger	**Temple tap**	Always turned on	Voice command at interaction start
3 · Guest matching	Staff selects guest or visit	Scan booking / room code, then confirm	**Face match suggests guest; staff confirms**

Hands-free glasses capture; temple tap after opt-in; staff confirms matches; laptop drafts.

PROCESS

Captured interactions become drafts for staff review and final saving.

FUNCTION 2 · MORPHOLOGICAL CHART

Green cells mark recommended choices; one per row.

SUBFUNCTION	OPTION A	OPTION B	OPTION C
1 · Processing location	Glasses-side processing (if supported)	**Laptop processes glasses input locally**	Hotel on-prem server
2 · Speech output format	Key-fact summary	Full transcript; no speaker labels	**Full transcript with speaker turns**
3 · Draft creation method	Rules map transcript details into fields	**Model drafts fields with source / profile evidence**	Staff fills a structured form
4 · Review queue order	**Chronological; review every draft when free**	Low-confidence drafts first; review all	Urgent-issue drafts first; review all

Laptop-local processing; all interactions stay drafts; staff reviews and saves.

DISPLAY

Display delivers relevant guest information through the staff’s chosen channel.

FUNCTION 3 · MORPHOLOGICAL CHART

Green cells mark recommended choices; one per row.

SUBFUNCTION	OPTION A	OPTION B	OPTION C
1 · Staff-facing medium	Laptop dashboard: rich detail, but attention shifts	**Smart glasses: glanceable eye-line cue, hands free**	Earpiece audio: hands-free; private info is audible
2 · Display trigger policy	**Immediately after staff confirms match**	Only after staff requests a cue	At next defined service step after match
3 · Information scope	Guest name	Name + area-relevant preference	**Name + area-relevant preference + active task**
4 · Complete-cue availability	**Lookup after match; show full cue when ready**	Lookup on likely match; show full cue after confirmation	Preload full guest cues; show only after confirmation

Render the full cue together; urgent tasks first; measure match-to-cue p50/p95.

WHAT TO PERSONALISE

Start with information that changes a specific service action during this stay.

CANDIDATE	POSSIBLE SAME-STAY ACTION	VALIDATION QUESTION
Food or drink preference	Offer a suitable option; confirm it still applies	Would another staff member use this later in the stay?
Purpose or schedule	Offer a useful breakfast or transport option	Is this appropriate to ask and share?
Special occasion	Offer a fitting acknowledgement	Would the guest welcome this being remembered?

PRIMARY EXAMPLE TO VALIDATE **A guest says “I prefer oat milk.” Later, F&B staff offers a suitable drink and checks that the preference still applies.**

ALLERGY IS A SAFETY ALERT, NOT A PREFERENCE. Verify against the authorised source and food-safety process; never rely on a face match alone.

WHERE SHOULD WE TEST IT?

Why does the Club Lounge provide the optimal testing ground?

Setting	Guest context	Handoff pattern	Project relevance	Role
Hotel lounge	Dietary needs, F&B preferences, open requests	Context may pass between staff during the same stay	Matches the lounge-service cue task	Assigned pilot
Front desk	Arrival details and stay preferences	Profile lookup at check-in	Baseline for access to OPERA guest context	Alternative
Main restaurant	Dietary needs and meal preferences	Coordination between service and kitchen teams	Strong F&B relevance; different service workflow	Alternative
Concierge	Activities, transport and guest requests	Follow-up across staff or departments	Broad handoffs beyond lounge F&B	Alternative

The lounge combines F&B personalisation with staff-to-staff information handoff.
